

## Four Ways to Add Sound to Your Security

April 2021

---

If you're curious about how you can be a part of the growing trend to add sound to security, here are four types of installations where audio is commonly used with video systems.

The use of sound in security systems isn't a new idea, but is new to many installers who have traditionally used video by itself. If you're looking to offer a more complete security solution that includes audio, SoundSecure can show you how.

### **Interview Rooms**

Law enforcement facilities will regularly record audio in interview rooms when conducting investigations with suspects or witnesses. The recording and review of key information enables officers to accelerate investigations.

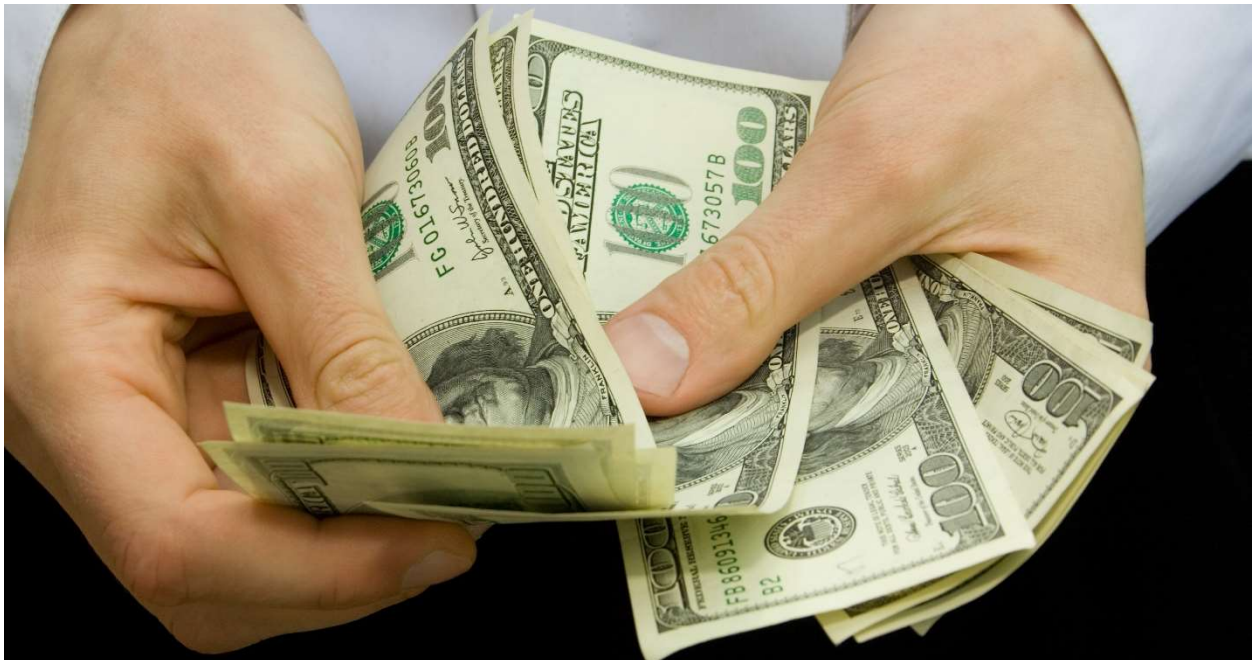

## Point of Sale

Across retail, convenience stores, quick service restaurants, or bank teller windows, audio will capture the interactions between employees and customers. Recordings can capture key evidence in the case of theft or fraud and also improve everyday operations by ensuring employees follow proper procedures and service guidelines.

## Cash Count Rooms

Whether in casinos or in retail, audio added to video systems where large amounts of cash is handled can verify that employees are following proper procedures. In the case of short counts, audio can help to detect internal theft or absolve employees of wrongdoing.

## **Corrections Facilities**

In an environment with such critical systems and processes, audio is commonly used in intake or processing rooms and common areas. Sound can be used to detect early warnings of imminent threats such as assaults and gain evidence in the event of escalating incidents.
